

ProudMe app-to-Qualtrics workflow for children's screen-use context EMA

What was implemented: A signal-contingent EMA workflow in which the ProudMe iOS app delivered scheduled push notifications. When a child tapped the notification, the app routed the child through an in-app survey entry point, an Apple-required parental gate, and then to an LSU Qualtrics survey in the web browser.

34

children enrolled in the EMA deployment roster

30

planned prompt opportunities per child across implemented bursts

15 min

response window before a prompt was counted as missing

5 min

one reminder after the initial notification

Implementation Pathway

1

Signal scheduled

Prompt windows were pre-specified by camp/remote/post-test day and time block.

2

ProudMe notification

The child received a ProudMe Survey push notification on the study phone.

3

Grown-up check

Apple child-app policy required a parental gate before opening the external web survey. Children could solve it or ask a parent/guardian for help.

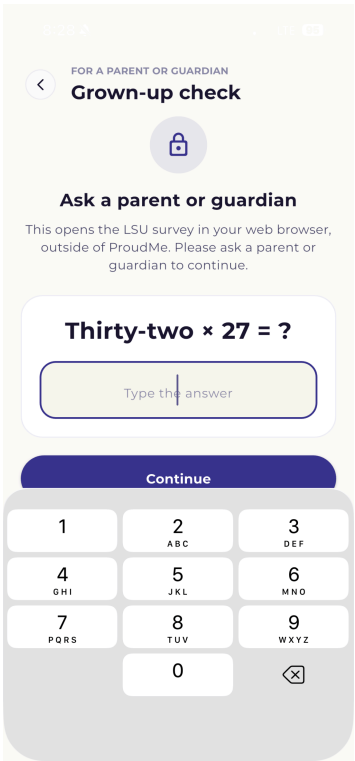

4

Qualtrics EMA

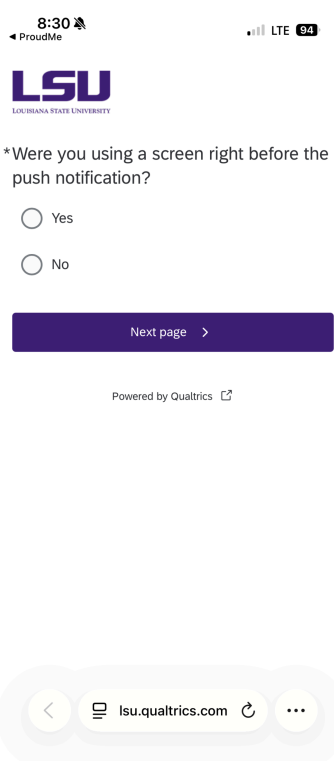

The browser opened the LSU Qualtrics survey, with PID and prompt metadata passed through the URL/embedded fields.

Push notification: ProudMe Survey prompt asks the child to take a quick survey.

Parental gate: arithmetic gate required before the app opens the external LSU survey.

Web survey: Qualtrics captures the screen-use context EMA items.

Implemented schedule, survey logic, and traceable data chain

Implemented Prompt Schedule

Period	Dates	Cohort / setting	Daily prompt blocks
Week 5	Jul 14-16, 2026	Cohort 1 camp; Cohort 2 remote	Camp: blocks 3-4 after camp. Remote: blocks 1-4.
Week 6	Jul 21-23, 2026	Cohort 1 remote; Cohort 2 camp	Camp: blocks 3-4 after camp. Remote: blocks 1-4.
Post-test	Jul 28-30, 2026	Both cohorts	Remote/post-test: blocks 1-4.

Block 1

8:00 AM-11:00 AM

Block 2

11:00 AM-2:00 PM

Blocks 3-4

2:00 PM-5:00 PM and
5:00 PM-8:00 PM

What the EMA Measured

- Screen use immediately before the prompt.
- Behavioral context before the prompt, including learning, socializing, resting, chores, physical activity, eating/drinking, and other activities.
- Screen type and device when a child reported screen use.
- Social context: whether the child was alone and, if not, who was present.
- Location immediately before the prompt.

Skip logic: Screen-related follow-up items were displayed only when relevant, and social-context follow-up was skipped when the child reported being alone.

Data

Enrollment	Children created ProudMe accounts; staff enrolled participants through the admin dashboard by spreadsheet upload.
Identifier	Dashboard PID was carried into the Qualtrics URL and stored as an embedded field for roster linkage.
Metadata	Block ID, prompt ID, and sent_at fields supported prompt-level reconciliation when preserved.
Outcome	Responses were classified by completion and by whether they occurred within the 15-minute response window.

Implementation Lessons Documented

- The strongest technical success was the PID chain from ProudMe/dashboard to Qualtrics export and roster matching.
- The response pathway was more complex than a simple notification-to-survey click: notification, in-app entry, parental gate, external browser, and Qualtrics.
- Delivery depended on app build/version, notification permission, and enrollment status; these preconditions were not recorded for every child.
